

# *Res-Q*<sup>®</sup> Orosine

Breakthrough cell regeneration formula

Because cell health is the key to the prevention of heart disease and its dangerous consequences

## According to top cardiologists, Orosine should be taken every day to maintain a healthy heart and prevent disease before it begins

Sudden cardiac death (SCD) or cardiac arrest, is the abrupt loss of heart function that can sneak up on you with no warning signs or previous symptoms. About half of all deaths from coronary heart disease are sudden and unexpected, meaning you may not even know that there is a problem until it is too late.

In cardiac arrest, the heart begins to exhibit a rapid and/or chaotic activity called ventricular fibrillation. Some are due to extreme slowing of the heart. All of these events are called life-threatening arrhythmias that can result in death within minutes.

**Res-Q Orosine** is a highly effective supplement for people with heart problems or people who have already suffered a heart attack, as it can prevent secondary complications and ultimately heart failure. **Res-Q Orosine** will give you a better chance to survive by lessening the potential for arrhythmias, increasing blood flow to the heart, allowing oxygen to be more readily available to the cell, all of which reduce the risk of sudden cardiac arrest.

---

### How many times have you heard the story about someone having a heart attack who just recently had a normal stress test, no symptoms and the doctor said he or she was fine?

---

Certain risk factors are known to play a part in sudden cardiac death. For instance, if you have high blood pressure, you may not know that your heart can enlarge so much that it can no longer function properly. Degeneration of the heart muscle or cardiac enlargement in patients with high blood pressure can cause sudden cardiac death.

Another example would be someone who might have a small amount of plaque on their arteries that doesn't interfere with the blood flow. You have no symptoms, a negative stress test and no angina. But in some cases with plaque, a very small piece can

break off, travel down the artery and block it, causing this electrical disturbance that results in sudden cardiac death. Half of all deaths due to atherosclerosis are sudden and unexpected.

### Do you have one or more of the following risk factors?

- Excess belly fat / weight problems
- High blood pressure
- High cholesterol
- High blood sugar
- Lack of exercise
- Stressful lifestyle
- Heart disease
- Family history of diabetes or heart disease

If you answered yes to any of these, **Res-Q Orosine** is essential for you.

**Res-Q Orosine is essential in prevention for all individuals with risk factors because it can help correct unknown problems before disease can occur.**

**Cell health is the key to the prevention of heart disease and its dangerous consequences.**

We may not think of our heart as a collection of individual cells. But it is the complex interaction of many different cell types that give the heart its ability to pump blood. Some cells form heart connective tissue, other cells grow into heart valves. Muscle cells give the heart its ability to beat and pump blood throughout the body. The health of your heart is determined by the health of the cells that make up your heart. When the majority of cells are healthy, your heart is likely to be healthy. When cells are damaged, problems can occur.

Damage to the cells can occur from years of stress, high blood pressure, high cholesterol, atherosclerosis, extra fat around the middle and years of inactivity (the risk factors mentioned above). Most people fall into one or more of these categories as they begin to age. Many may even be walking around feeling no symptoms at all. It is inevitable that as we age, the requirement for continued cell growth and repair is the most important underlying process in maintaining a healthy heart. **Res-Q Orosine** can restore the integrity of the injured cell and minimize the damage to those cells.

Understanding the mechanism of cell metabolism is the foundation in the development of **Res-Q Orosine**. This is the first product of its kind that works directly on the red blood cells to improve the delivery of oxygen to the heart, relax blood vessels and improve blood flow to the heart, thus reducing the risk of a heart attack or sudden cardiac arrest.
